1 Kinematics

$$M\dot{\nu} + C(\nu)\nu + D(\nu)\nu + g(\eta) + g_0 = \tau \tag{1}$$

$$M = M_{RB} + M_A$$
$$C = C_{RB} + C_A$$

$$\tau = \tau_{hydrodynamics} + \tau_{hydrostatics} + \tau_{wind} + \tau_{wave} + \tau_{control}$$
 (2)

1.1 Control

$$\tau_{control} = \begin{bmatrix} \tau_{control,linear} \\ \tau_{control,torque} \end{bmatrix}$$
(3)

Each propeller can rotate with an angle ξ_p . The thrust of each propeller can be describe as a vector by spilting it into components that align with the ship coordinate frame

$$T_p = \begin{bmatrix} \cos(\xi_p) \\ \sin(\xi_p) \\ 0 \end{bmatrix} t_p \tag{4}$$

where t_p is the magnitude of the thrust and T_p is the thrust vector. The linear control force is found as the sum of forces from each propeller p.

$$\tau_{control,linear} = \sum_{p}^{P} T_{p} \tag{5}$$

$$\tau_{control,torque} = \sum_{p}^{P} r_p \times T_p = \sum_{p}^{P} S(r_p) T_p$$
 (6)

where r_p is the position vector of thruster p and $S(r_p)$ is the skew-symetric matrix of vector r_p .
